Variable Pattern into April Demand Loss from Friday

1 to 5 Day

6 to 10 Day

11 to 15 Day

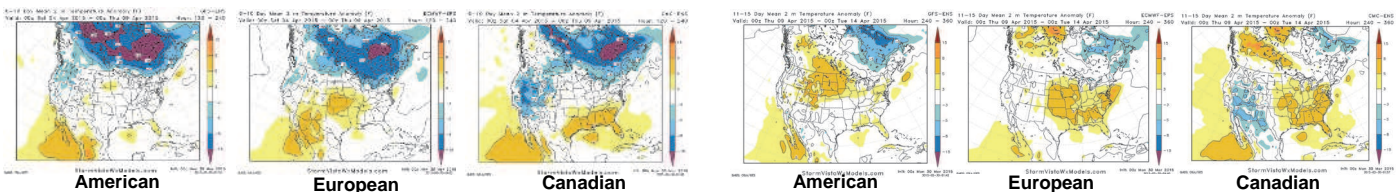

Demand Loss, but Risks on Both Sides. We continue to track a challenging pattern dynamic as strong cold air supply resides across central to eastern Canada, but active influences from the Pacific prevent much of it from getting into the U.S. Changes are mixed today, but see more lower demand than higher demand adjustments compared to Friday's forecast. Some cooler changes midweek on the East Coast are offset by warmer changes late this week into the start of the weekend. More widespread warmer changes across the South next week also offset some cooler changes there this coming weekend. The 11-15 day is not as warm as forecast yesterday across the Midwest, East, and South, but the pattern still navigates toward that warmer look as the models show some marginal Western cooling. Risks are generally to the warmer side for the middle third of April with some chance to shift back cooler again late in the month.

Weather Model Landscape: 2-Meter Temperature Anomalies

6-10 Day

11-15 Day

Models show a mixed enough pattern for 6-10 day to keep Midwest to East mostly near normal while South warms; 11-15 warm, but not as warm as yesterday

Upcoming Updates

Middle April Warmer Risks

Late April Cooler Chances
